

DCWarehouse Automation Wireless and Real-Time Inventory Counting Features

Counting your inventory by hand or using count cards, spread-sheets or non-integrated systems can be time consuming and is prone to errors. That is precisely why you should consider using our real-time bar-code and wireless scanners to eliminate these problems.

Leveraging the Sage MAS 500® Data allows you to count by ranking (Gross Margin, Hits, Sales Volume, Item Value), bins, item, item type and more. As a result you can determine what items to count and when. Cycle counting on a regular basis not only increases inventory accuracy but also can identify shrinkage and prevent further loss.

DCWMS has several features that not only help you count your inventory quickly and accurately, but simultaneously allows you to continue your important sales and shipping activities.

DCWarehouse Features Include:

- Completely Wireless Scanning and Counting in Real-Time!
- An Auto Adjust Feature to add picked or received quantities into your Cycle-Count Totals.
- Blank Card Functionality allows users to add items/bins to their cycle count that were not already included at that location.
- The ability to enable UPC Codes for your beginning balance entry or cycle count entry.
- An optional Blind Count Feature that does not show the users how many items are frozen so they are forced to count all the items and not just key in the number they see.
- A Bin Sweep and Scan feature that forces the user to scan the bin with each transaction.
